Buick V6 Trigger Wheel Installation Instructions

BHJ Buick V6 O.E.M. replacement trigger wheels are designed to be installed using a common arbor press or hydraulic press, which can typically be found at automotive and machine shops.

The trigger wheel is to be oriented with the transition from a raised tab, to a slot opening occurring at 55 degrees clockwise from the centerline of the keyway, (when looking at the face of the damper).

This orientation is in accordance with data found in the Buick Power Source book, which is reproduced below. As the book states, this configuration will produce 10 degrees of base timing, using the stock system and components.
